

Architecture Verification Report

1. Verification Overview

This report documents the verification of the software architecture description. Verification ensures correctness, completeness, and consistency of the ADL prior to architectural validation.

Verification Scope

Verification evaluates the architectural description independently of quality attributes. It focuses on structural correctness, architectural completeness, and internal consistency.

2. Verification Result

The architecture description successfully passed all verification layers. The ADL is correct, complete, and internally consistent, and is therefore eligible for architectural validation.
